Human Development Index (2011)	0.733
Median age (in years) (2010)	30
Total fertility rate per woman (2010)	2.2

The Government of Azerbaijan reports as follows.

National coordination

There is no written national strategy or plan that focuses exclusively or primarily on the prevention and control of viral hepatitis.

There is a designated governmental unit/department responsible solely for coordinating and/or carrying out viral hepatitis-related activities: Republican Centre of Hygiene and Epidemiology, Department of Intestinal Infections. It has three staff members. There is one full-time equivalent staff member who works on hepatitis-related activities in all government agencies/bodies.

The government has a viral hepatitis prevention and control programme that includes activities targeting the following specific population: pregnant women.

Awareness-raising and partnerships

The government held events for World Hepatitis Day 2012 but has not funded other viral hepatitis public awareness campaigns since January 2011.

The government collaborates with the following in-country civil society group to develop and implement its viral hepatitis prevention and control programme: Vishnevskaya-Rostropovich Foundation.

Evidence-based policy and data for action

There is routine surveillance for viral hepatitis. There is a national surveillance system for the following types of acute hepatitis: A, B and C, but not for any type of chronic hepatitis.

There are standard case definitions for hepatitis. Deaths, including from hepatitis, are reported to a central registry. No hepatitis case is reported as "undifferentiated" or "unclassified" hepatitis.

Liver cancer cases and cases with HIV/hepatitis coinfection are registered nationally.

The government publishes hepatitis disease reports monthly.

Hepatitis outbreaks are required to be reported to the government and are further investigated. There is adequate laboratory capacity nationally to support outbreak investigations and other surveillance activities for hepatitis A, hepatitis B and hepatitis C, but not for hepatitis E.

There is no national public health research agenda for viral hepatitis. Viral hepatitis serosurveys are conducted regularly; the target populations are pregnant women, blood donors and medical staff. Information was not provided on when the last serosurvey was carried out.

Prevention of transmission

There is no national policy on hepatitis A vaccination.

The government has not established the goal of eliminating hepatitis B.

Nationally, 99% of newborn infants in a given recent year received the first dose of hepatitis B vaccine within 24 hours of birth and 96% of one-year-olds (ages 12–23 months) in a given recent year received three doses of hepatitis B vaccine.

There is a national policy that specifically targets mother-to-child transmission of hepatitis B (Annex B).

There is no specific national strategy and/or policy/guidelines for preventing hepatitis B and hepatitis C infection in health-care settings. Health-care workers are not vaccinated against hepatitis B prior to starting work that might put them at risk of exposure to blood.

There is a national policy on injection safety in health-care settings, which recommends auto-disable syringes for therapeutic injections. Single-use or auto-disable syringes, needles and cannulas are always available in all health-care facilities.

Official government estimates of the number and percentage of unnecessary injections administered annually in health-care settings are not known.

There is a national infection control policy for blood banks. All donated blood units (including family donations) and blood products nationwide are screened for hepatitis B and hepatitis C.

There is no national policy relating to the prevention of viral hepatitis among people who inject drugs.

The government has guidelines that address how hepatitis A and hepatitis E can be prevented through food and water safety.

Screening, care and treatment

Health professionals obtain the skills and competencies required to effectively care for people with viral hepatitis through schools for health professionals (pre-service education) and postgraduate training.

There are no national clinical guidelines for the management of viral hepatitis. Information was not provided on whether there are national clinical guidelines for the management of HIV, which include recommendations for coinfection with viral hepatitis.

The government does not have national policies relating to screening and referral to care for hepatitis B or hepatitis C.

People testing for both hepatitis B and hepatitis C register by name; the names are kept confidential within the system. Hepatitis B and hepatitis C tests are free of charge for all individuals, and are compulsory for pregnant women, blood donors and medical staff.

Publicly funded treatment is not available for hepatitis B or hepatitis C.

The following drugs for treating hepatitis B are on the national essential medicines list or subsidized by the government: lamivudine and tenofovir. The following drug for treating hepatitis C is on the national essential medicines list or subsidized by the government: ribavirin.

The Government of Azerbaijan welcomes assistance from WHO in one or more areas of viral hepatitis prevention and control (Annex C).
