

France

Population (in millions) (2011)	63.1
Country classification (2012)	High-income
Gross national income per capita (PPP int \$) (2011)	\$35 910
Total health expenditure as % of GDP (2010)	11.88%
Per capita total health expenditure (PPP int \$) (2010)	\$4020.73
Per capita government health expenditure (PPP int \$) (2010)	\$3130.10
Life expectancy at birth (in years) (2009)	81
Human Development Index (2011)	0.919
Median age (in years) (2010)	40
Total fertility rate per woman (2010)	2

The Government of France reports as follows.

National coordination

There is a written national strategy or plan that focuses exclusively on the prevention and control of viral hepatitis. It includes components for raising awareness, surveillance, vaccination, prevention in general, prevention of transmission via injecting drug use, prevention of transmission in health-care settings, and treatment and care.

There is a designated governmental unit/department responsible solely for coordinating and/or carrying out viral hepatitis-related activities: Bureau Infections par le VIH, IST et Hépatites (DGS-RI2). Information was not provided on how many staff members this office has. It is not known how many people work full-time on hepatitis-related activities in all government agencies/bodies.

The government has a viral hepatitis prevention and control programme that includes activities targeting the following specific populations: health-care workers (including health-care waste handlers), people who inject drugs, migrants, prisoners and people living with HIV.

Awareness-raising and partnerships

The government held events for World Hepatitis Day 2012 but has not funded other viral hepatitis public awareness campaigns since January 2011.

The government collaborates with the following in-country civil society groups to develop and implement its viral hepatitis prevention and control programme: Federation SOS-Hépatites, Hépatites Infos Services and Collectif Hépatites Virales.

Evidence-based policy and data for action

There is routine surveillance for viral hepatitis. There is a national surveillance system for the following types of acute hepatitis: A and B, and for chronic hepatitis B.

There are standard case definitions for hepatitis. Deaths, including from hepatitis, are reported to a central registry. The percentage of hepatitis cases reported as "undifferentiated" or "unclassified" hepatitis is not known.

Liver cancer cases are not registered nationally, but cases with HIV/hepatitis coinfection are.

The government publishes hepatitis disease reports annually.

Hepatitis outbreaks are required to be reported to the government and are further investigated. There is adequate laboratory capacity nationally to support investigation of outbreaks and other surveillance activities.

There is a national public health research agenda for viral hepatitis. Viral hepatitis serosurveys are conducted regularly; the target populations are the general population, prisoners, people who inject drugs and men who have sex with men. The last serosurvey was carried out in 2011.

Prevention of transmission

There is a national policy on hepatitis A vaccination.

The government has not established the goal of eliminating hepatitis B.

It is not known what percentage of newborn infants nationally in a given recent year received the first dose of hepatitis B vaccine within 24 hours of birth. In a given recent year, 53% of one-year-olds (ages 12–23 months) received three doses of hepatitis B vaccine.

There is a national policy that specifically targets mother-to-child transmission of hepatitis B (Annex B).

There is a specific national strategy and/or policy/guidelines for preventing hepatitis B and hepatitis C infection in health-care settings. Health-care workers are vaccinated against hepatitis B prior to starting work that might put them at risk of exposure to blood.

There is a national policy on injection safety in health-care settings, which recommends single-use syringes for therapeutic injections. Single-use or auto-disable syringes, needles and cannulas are always available in all health-care facilities.

Official government estimates of the number and percentage of unnecessary injections administered annually in health-care settings are not known.

There is a national infection control policy for blood banks. All donated blood units (including family donations) and blood products nationwide are screened for hepatitis B and hepatitis C.

There is a national policy relating to the prevention of viral hepatitis among people who inject drugs.

The government has guidelines that address how hepatitis A and hepatitis E can be prevented through food and water safety.

Screening, care and treatment

Health professionals obtain the skills and competencies required to effectively care for people with viral hepatitis through schools for health professionals (pre-service education), on-the-job training and postgraduate training.

There are national clinical guidelines for the management of viral hepatitis, but they do not include recommendations for cases with HIV coinfection. There are national clinical guidelines for the management of HIV, which include recommendations for coinfection with viral hepatitis.

The government has national policies relating to screening and referral to care for hepatitis B and hepatitis C.

People testing for both hepatitis B and hepatitis C register by name; the names are kept confidential within the system. Hepatitis B tests are not free of charge for all individuals, but they are free of charge in specific preventive centres. Hepatitis C tests are free of charge for all individuals. Hepatitis B tests are compulsory for people who begin health professional studies and for pregnant women. Hepatitis C tests are not compulsory for members of any specific group.

Publicly funded treatment for hepatitis B and hepatitis C is available to all participants in the national health insurance programme ("Sécurité Sociale").

In 2009, the national health insurance programme spent approximately €450 million (US\$ 578.7 million) for the treatment of chronic hepatitis B and hepatitis C.

The following drugs for treating hepatitis B are on the national essential medicines list or subsidized by the government: interferon alpha, pegylated interferon, lamivudine, adefovir dipivoxil, entecavir, telbivudine and tenofovir. The following drugs for treating hepatitis C are on the national essential medicines list or subsidized by the government: interferon alpha, pegylated interferon, ribavirin, boceprevir and telaprevir.

The Government of France welcomes assistance from WHO in one or more areas of viral hepatitis prevention and control (Annex C).
